

RECOMMENDATIONS FOR SYMPTOMATIC RELIEF OF BURNING AND STINGING ASSOCIATED WITH CYSTITIS IN WOMEN

FOR PHARMACISTS ONLY

What is Cystoplus®?

Cystoplus® is specially indicated for the symptomatic relief of the burning and stinging associated with cystitis in adult women. The active ingredient of Cystoplus® is **sodium citrate**, which is an alkalizing agent clinically proven to provide significant cystitis symptom relief by decreasing the acidity of the urine (raising the pH), thereby reducing the painful burning sensation and stinging associated with cystitis.†

When should I recommend Cystoplus®?

What do you currently recommend for your patient's cystitis symptoms? If you are unsure what to suggest to provide symptomatic relief while UTI treatment takes effect, consider recommending Cystoplus®.

Recommend Cystoplus:

- When you prescribe an antibiotic*^{††}
- To relieve burning
- To relieve stinging
- For effective symptomatic relief

... at any stage of cystitis

Cystoplus® is not recommended for use during pregnancy or breastfeeding, and it is also not advised for use in men and children.

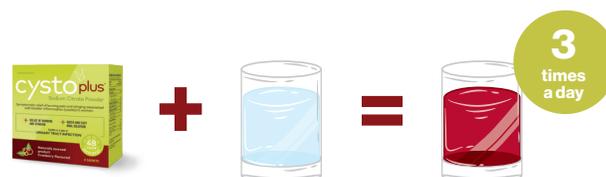

How should I advise my patients to take Cystoplus®?

Cystoplus® is a convenient and complete 48-hour symptomatic treatment program. Advise your patients to dissolve the contents of one sachet of cranberry-flavoured powder into a glass of water and drink it, 3 times a day, for 2 days. Counsel your patients not to take more than three sachets in one day. If they accidentally take more, advise them to seek medical advice immediately.

† Open study involving 205 women presenting with symptoms of cystitis and no clear evidence of bacterial infection. Symptoms were assessed at study entry and on the third day (severity of symptoms evaluated on a four-point scale: absent, mild, moderate, severe).

* IMPORTANT: The patient should not repeat the treatment without medical advice.

†† Although Cystoplus is not contraindicated for use with antibiotics, patients should always inform their doctor if they are taking any other medication. Its alkalizing effect on urine, sodium citrate have effect on some antibiotics excretion and changes/affect its pharmacokinetic profile.

Always direct the patient to read the label.
